

ABSTRACT OF THE DISCLOSURE

1 A shower head for selectively adding liquid soap to shower water. A partition
2 contained in the nozzle defines first and second chambers contained in the nozzle.
3 A reservoir contained in the nozzle holds the liquid soap therein and fluidly
4 communicates with the second chamber. An apparatus contained in the nozzle
5 selectively directs water from a water source into either the first chamber where it
6 exists the nozzle as the shower water or into the second chamber where by creating
7 a negative pressure due to its flow draws down the liquid soap from the reservoir to
8 mix therewith and exit the nozzle as soapy shower water.
